ASSIGNMENT - 2

Q1 Fill in the blanks

1. Entity Relationship (ER) Model.
2. Relational.
3. Object - oriented.
4. Integrity.

Q2 →

Ans → In a healthcare system, data abstraction means hiding complex databases details and showing only the information that a user needs. This makes it easier for healthcare professional to interact with patient records.

The data abstraction helps in a way that :-

- It simplifies information Access.
- And Display only Role - Based information.
- It Reduces complexity.
- It Improves data security
- And Easier System maintenance

Q3 →

Ans → Benefits

1. Ease of use: Healthcare professionals can easily access patient information without understanding complex database structures.

2. Improved security: Sensitive patient data is protected because users only see the information they are authorized to access.

3. Reduced complexity: The system hide complicated datause operations and show only necessary data.

→ Challenges

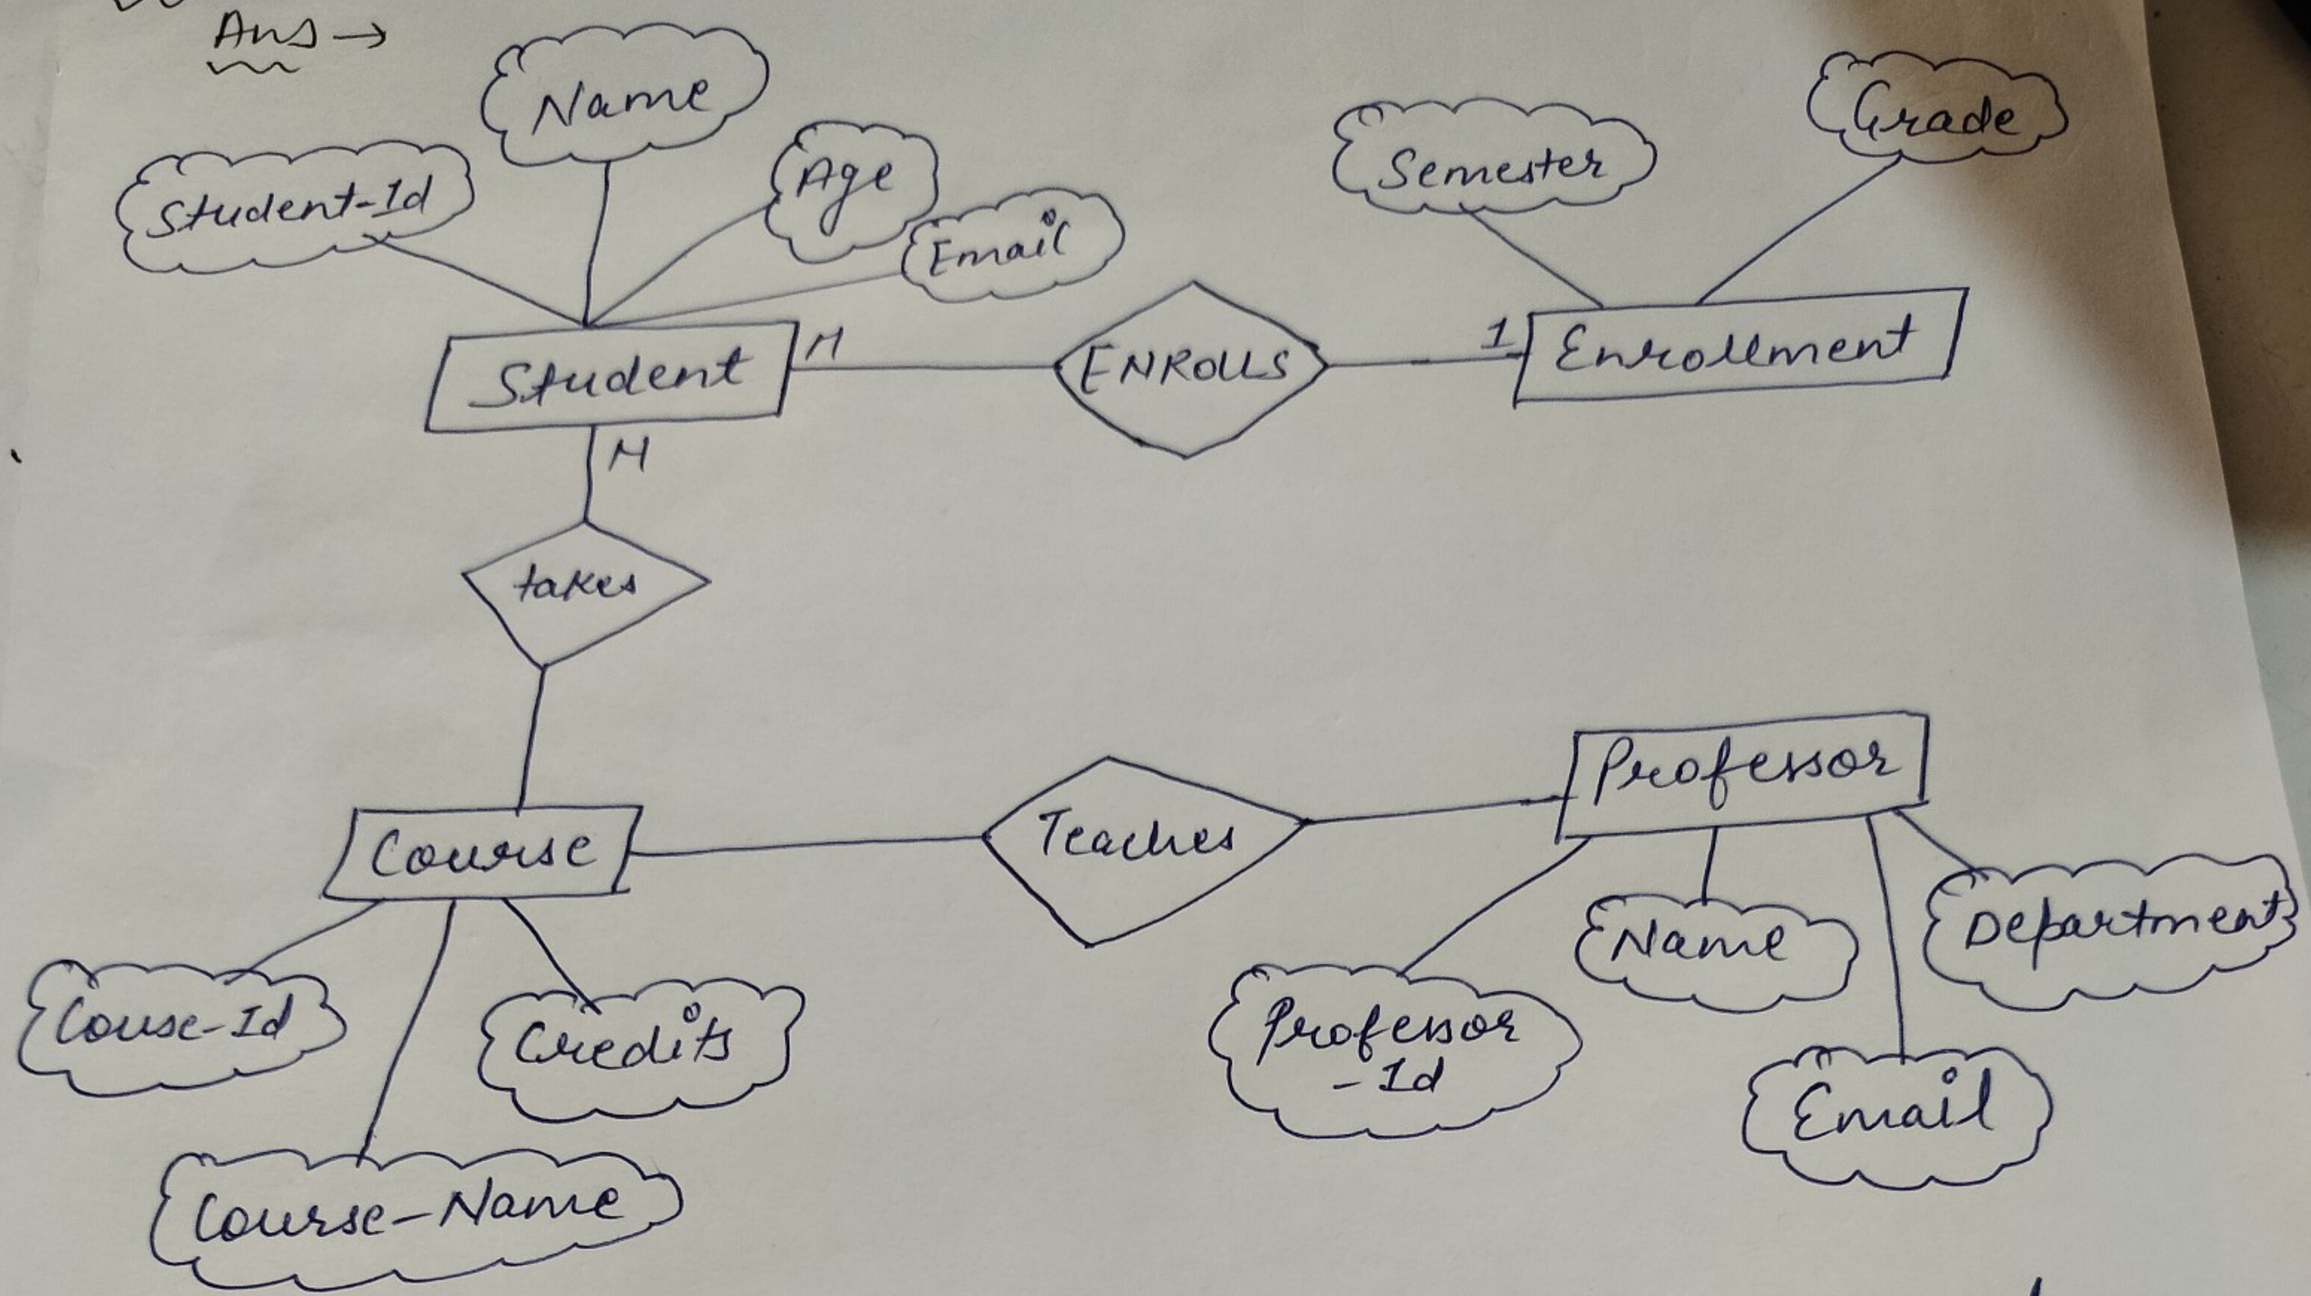
1. System design complexity: Creating proper abstraction layers can be difficult and requires careful system design.

2. The challenge which can occur be performance issus.

3. updating the system or fixing the errors can be a challenge for maintenance.

Q4 →

Ans →



Here the relationship is between student and Enrollement whose cardenality is many to one because many student can enrolls and a relation between student and course that is - Many to one because many student can takes one course and a relationship between course and professor which is may to one because a professor can teach many courses.
